Power Breaker RCD gets an update

GreenBrook is celebrating the 35th anniversary of its first PowerBreaker RCD with the launch of an updated range of RCD adapters, spurs and sockets.

The new PowerBreaker range features a typical trip speed of less than 20mS, which means that it will respond to a current leakage more than twice as fast as most other RCD products on the market. The PowerBreaker's module has also been re-designed to offer a more contemporary and ergonomic casing with a more robust latching design. The updated range also features a brighter warning light to further improve safety.

The launch comes at a time when the importance of using RCDs is already being raised in the public consciousness by the Electrical Safety Council's national 'Plug In to Safety Campaign', which is designed to develop understanding of the role of RCDs in improving safety and encourage greater usage.
